### ABSTRACT

The stem 'English Language Instruction' is originated from a Germanic tree which has been pullulating multidimensional offshoots laden with the developmental fruits. Broadly speaking, it would be arduous to prosper in the modernistic mechanism of this globe without absorbing the energy of English language as it has secured the status of a global language spoken and written in most of the countries either as a native or as a second language. In addition, it has a dynamic energy which is capable to exchange divergent literary thoughts, techniques and scientific inventions which are taking place in both developed and developing countries. On a more profound level, it is explicit that it has generated a sort of cosmopolitan manpower that can be applied anywhere in the world for the amelioration of the whole humanity. In the domineering scenario of the 21<sup>st</sup> century, English language has been a lingua franca of the entire world that is, in these days, passing through an evolutionary revolution. In fact, it is the energy of English Language Instruction that is playing the role of worldwide transmission related to any branch of knowledge such as medicine, transport, business, trade, technology, culture, marketing and literature etc. In the current circumstances, it is the master key that can unlock or analyze any innovative discipline of both national and transnational growth. So far as the matter is concerned, the evolutionary impression of modernization with the imprints of westernization is prevailing all over the world with the assistance of English skills – Reading, Writing, Speaking & Listening. As a matter of fact, English is a link language that can create a harmonious relationship between any two distant poles or persons. Consequently, it is right to argue that English language – an opulent warehouse of all dominative disciplines – provides us the knowledge of all innovative techniques which are emerging at the other end of the world. Moreover, it is the language that may be utilized in any corner of the earth whether it is the matter of communication or transmission. Thus, this research article, basically, explores the energy of 'English Language Instruction' that is, nowadays, an energetic source of national and international growth.

**Keywords:** English, energy, language, growth, national and international etc.

### Introduction

The term 'English' is derived from the surname 'Angle', the name of a Germanic tribe which is thought to be originated from the Angeln area of Jutland, a part of northern Germany. In fact, Germanic people invaded Britain and settled there in the fifth century A. D., and, thus, Britain became the main originating source of English language. Shorter Oxford English Dictionary defines the term 'English' as 'the language spoken by the Germanic invaders of Britain in the 5<sup>th</sup> cent. A. D. Now, the language descended from this, used in Britain, Ireland, Australia, New Zealand, the U.S., Canada, and many other countries.'<sup>1</sup> Similarly, Webster's Encyclopedic Unabridged Dictionary of the English Language specifies the term 'English' as 'the Germanic language of the British Isles, widespread and standard also in the U.S. and most of the British Commonwealth, historically termed Old English (c 450–c 1150), Middle English (c 1150–c 1475), and Modern English (after c 1475)'.<sup>2</sup>

By the time the Germanic tribes had settled down in Britain, the land included Scotland, which had hitherto been unknown as a region. Britain thus became a land that accommodated the Scots from Ireland, the Britons concentrating in Wales and the Germans in its southern part. The Angles, Saxons and Jutes soon had accepted a common name for their identity and came to be known as Angles which term came to fix as English, after transformation into *Engles* and *Englese*. The southern land became almost their property and was called *Angles* land which became *Engles* land, and *Engle* land and *England* at last. Their dialects namely Jutic, Saxon and Angles respectively were called by a common name *Angles* which became *English* because of the interrelatedness of the dialects.<sup>3</sup>

Nowadays, English is striving to achieve the status of the most popular language of the world. It passes through multi-dimensional routes sprinkling almost all significant tracts of human offshoots. In the present circumstances, it is not easy to make the stem of human race stronger and longer without the watering of English language. In some countries, it is spoken and written as a native language and in many others as a second language. Moreover, it has an observable impact of dealing with different

literary features, technical properties and prevailing professionals which are efficacious in the existing scenario of the 21<sup>st</sup> century. As a matter of fact, English language is nothing but a lingua-franca of the whole globe developing under the impression of versatile betterment. The process of communication whether it is related to any profession, transportation, medication, science, technology, culture or literary structure is executed successfully with the assistance of English language. More or less, it has all the functional properties of a master key that can open or analyse all the literary, technical and professional aspects of human development. Consequently, it has got the credit of an international language.

English has rather grown enormously during the last few decades because of many scientific inventions. The gramophone, the telephone, the wireless and the tape-recording machine have, to some extent, done for the spoken language what printing did for the written. It is often said that the popularity of broadcasting is leading to an extension of the use of Standard English and a decline in the use of dialect. Because of its inventiveness, territorial expansion, numerical strength of speakers, immense power and influence, richness of vocabulary and expressiveness, and lastly, its fitness for purposes of trade, travel, modernity and culture, its Spanish, Italian, German and although new rivals, such as Russian, Chinese and Hindustani have appeared, they are still in no position to challenge the supremacy of English.<sup>4</sup>

In point of fact, English – a source of universal energy – is the most useful and fruitful language in the world. In addition, it has its deep roots in each and every part of the colonial construction which was erected by the Britishers. With the enlargement of British sovereignty, it stepped into India, Africa, South Asia, Australia, New Zealand, America and many other countries with the marks of indelible impression. In the earlier stages, it came to these countries as a language of trade and commerce, traffic and traverse, and exploration and expedition, but, with the passage of time, it became the sole medium of instruction in most of the countries. Nowadays, it has become the official language of the international affairs such as

business, air-traffic, shipping, United Nations Diplomacy, world banking, academic research, space travel, worldwide networking and all other disciplines of science and technology.

Undoubtedly, the modernistic world is stepping forward with the advancement of science and technology. It is the role of English language through which scientific and technical inventions of England, America, Germany, France and Russia are brought into the territories of India. Moreover, the modern system of education has intensified the role of English language at the international level because the most famous universities of the world utilize English as the medium of instruction, transmission and communication.

In addition, different methods of teaching-learning process – The Grammar-Translation Method, The Direct Method, The Bilingual Method, The Audio-lingual Method & The Audio-Visual Method etc.– prevailing in the world have been producing a number of energetic resources which may be utilized for the development of the human race with the modernistic face.

**Energetic Role of English Language in National and International Growth:** There are thousands of languages spoken in the world, and none can be able to adopt the knowledge of so many languages; therefore, the utilization of English is needed extensively. In reality, English is the bridge-language that can cover the gap between two different language speakers. It may be used as a common language between two distant speakers though their native or regional languages may be different.

As a matter of fact, the whole world is just like a theatrical stage on which dramatic play of human beings through the medium of English language is being showed. So far as the matter is concerned, energy of English language plays a dominant role in both human movement and improvement because the existence of human life cannot take place without the exchange of ideas, facts, money and goods; and it is the function of English language which carries out all these activities. In a local area, a native or regional language is used to execute this process, but when the process of communication or transmission is

carried out at the national or international level, energy of English language is required unanimously.

With the technocratic revolution prevailing in the globular stratum, the significance of English language has become stronger. The technological platform of the world refers to the international market that transfers technological concepts and outlets from one country to the other one through the medium of English language. Since the international market has been more radiative, competitive and aggressive, the importance of English language goes on augmenting. More or less, English language is having a profound influence on the multidimensional features of technical transmission, and there is a pressing requirement of English communication which may generate fruitful foundation of universal unification. In this reference, so far as the matter is concerned, Geetha Nagraj's view is quite quotable:

“Economic and technological forces played their part in keeping English at the centre of communication. The United States of America emerged as the leader in computer technology and English, by default, was the language it operated in. So, instead of remaining a quaint relic of colonialism, English succeeded in re-inventing itself as the language of global communication.”<sup>5</sup>

Broadly speaking, there are three dominant components on which the worldwide movement of human development is founded. The first component is the stream of science; the second one is the gleam of technology; and the third one is the energy of English Language Instruction. Science provides new inventions to human race, technology offers new techniques to human face while energy of English Language Instruction is the medium through which useful and profitable knowledge of advancement is transferred immediately from one part of the globe to the other one. As a result, it can be inferred that the real human preferment is based on a triangular shape which is made up of science, technology and energy of English Language Instruction. In this reference, S. C. Mundhra's thematic analysis is quite revealing:

Ours is the age of science and technology, with a small portion of time allowed as leisure. So English will have to make itself more scientific,

precise and brief.... Let us remain content with the present English speech and wish for the dawn of a better future. Let us also hope that the flourishing societies, like the Philological Society, the English Place-Name Society, the linguistic Society of America, and the Society for pure English will be able to brave the weather arising from time to time on the horizon of English and steer it through without failing.<sup>6</sup>

Moreover, if any profession is carried out at a large scale, English language is needed as the whole world has thousands of native, regional and local languages which cannot be learnt simultaneously for the communicative purpose. In this case, energy of English language plays the role of a mediator between two distant communicators or transmitters. As a whole, English is rather a professional language as it is used in most of the domestic and nationalistic occupations. Moreover, it is the main communicable language of the international transportation.

**Conclusion:** English is the only language that has the capacity to link one country with the other one. Besides, it is the language that is able to unite the human beings at the international level. We can talk to the persons of the U.K., the U.S.A., Canada, Australia, New Zealand, and many other countries if we are expert in the stream of English language. In the existing world, it is the most dynamic language that can be used as a means of communication for any purpose. It is rather a multidimensional traffic-platform on which the vehicles of human development, whether it is national or international, are running smoothly. Indeed, it has got the momentum of circulation in most of the universities, colleges, schools, Courts and many other official departments which are playing a prominent role in the field of literal, technical and professional advancement. Taking into consideration the aims of English language, S. C. Mundhra rightly states:

“The general aims of learning English have been three: English being a world-language promotes international understanding; it is a medium to come into contact with the best in cultural terms, that is, a medium for the study of arts and science; and lastly, it furthers our

vocational or professional interests, like law, medicine, engineering and technology.”<sup>7</sup>

In these days of globalization, it is explicit that English has become the universal language for literal, technical and professional communication. In spite of numerous cultural and traditional movements in support of vernacular languages, it has been growing and developing without any obstruction for the ages. In order to be successful in the global market, one must be proficient in the communicative skills of English language – Speaking, Listening, Reading and Writing. In the concluding scenario, H. S. Bhatia’s analytical observation is noticeable:

“The knowledge of English is also essential for understanding the modern science, trade, commerce, technological and industrial languages. In Information Technology, all computer language is based on English, though there might have been some influence thereon of several other languages also in various ways.”<sup>8</sup>

In fact, the whole world is nothing but a market place where the exchange of concepts, techniques and things is done unintermittedly. This interchange of goods cannot be done without active participation of English language. Undoubtedly, it is a living and vibrant language which has conquered all the worldly languages with its popularity, beauty and importance. It has held the potential performance in any sort of growth whether it is national or international. In addition, it has sowed the communicational seeds of aroma which are about to flourish into the form of global modernization with lingual unification. However, it is the youngest of all the languages of the world, it has been the leader of all the languages. Admittedly, the revolutionary impression of global evolution is extending everywhere under the shadow of an electronic umbrella which is charged with the energy of English language. Finally, it is right to argue that we cannot get the state of extreme growth whether it is national or international without the energetic knowledge of English language.
